

Easy to Use Cloud-based Phone System

Our cloud-based phone system is a full featured Hosted IP Solution that delivers an enterprise-grade phone system to small and medium-sized businesses without any increase in support staff. We offer reliable voice quality and performance. It is completely hosted within a fully meshed IP network—delivering a secure and redundant network.

Our solution is a complete communications system that includes phones, a calling plan for local, regional and long-distance calls, automatic system upgrades and training.

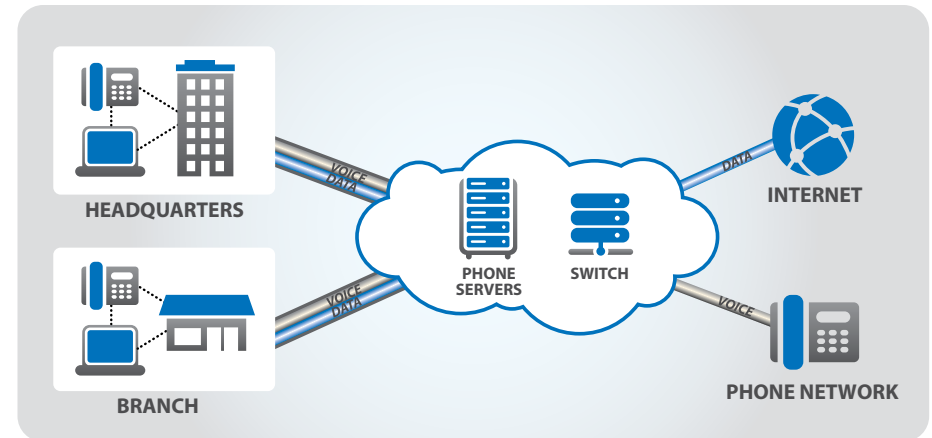

Our solution is flexible. It includes hundreds of features that let you customize the system to meet your specific needs. It also includes a website that gives employees and system administrators direct control over the system and preferences – eliminating the need for expensive maintenance contracts. It is scalable, allowing you to add phones, sites and employees as you need them—without having to add cards, expensive shelves or upgrade the system.

Extend seamless communications over the Internet to support remote offices, home-based workers, such as telecommuters and mobile professionals, with the same features and functionalities that are available on their office phones. Our solution is available nationwide and is 100 percent cloud-based. It can connect satellite and regional offices across the country with your main office – all on the same system and the same network.

Complete | Flexible | Scalable | Cost-efficient

Feature Highlights

- **Hot Desking** – enables employees to move around the office and between locations. Users simply log in to any phone and begin making/receiving calls or using any of the other features as if they were at their own desks.
- **Mobile Twinning** – sends calls simultaneously to an employee’s office extension and mobile phone. Users can retrieve the call on their mobile device and when they get back to their desk, continue the conversation on the office phone, without missing a moment.
- **Auto Attendant** – ensures effective call handling by allowing inbound callers to select options from a menu of prompts that can route calls to user extensions and company directories.
- **Call Redirect** – lets users and site administrators control and administer calls from a web browser.
- **Voicemail** – can be accessed from a phone, via a website or through e-mail, even on your smartphone.
- **Softphones** – make calls from any PC or mobile device using your office phone number.
- **Cordless Desk Phones and Handsets** – offer the flexibility you need for mobile employees and hard to reach places, without requiring any expensive wiring.
- **Customer Portal** – make changes to your system from anywhere online.
